

HALF TIME/DOUBLE TIME

FROM DIGGING DEEPER VIDEO #169

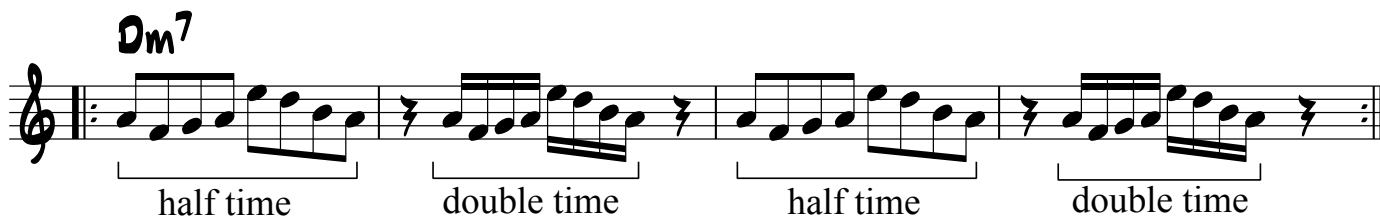

We've all heard the advice, and it makes sense. "Practice slowly." When something is hard, slow it down. But, how *really* should we do this? Is there a more precise exercise, a more powerful approach to working this way? There sure is. Slow it down EXACTLY in half.

#1 - C major Scale

- 1) Use a metronome. For sure.
- 2) Do this with short bits of music. Definitely less than two measures.
- 2) Develop the ability to "flip back and forth" between half time and double time.
- 3) When you are in the "slow motion zone," be VERY aware of what you are playing . . .
 - Are you getting all the correct notes?
 - Are your fingers precise, is your physical motion exact?
 - Is your tone consistent?
 - Is your volume even, or are those accents in place?

#2 - Moose The Mooche, measure 19

#3 - Hot House, measures 9 and 10
