

DIMINISHED VS. DOMINANT

FROM DIGGING DEEPER VIDEO #97

The lick we get to here is a classic one, made famous by many of the more modern players in the 1970's and since. It's a symmetrical lick - the relationship of the notes to each other are symmetrical, their intervals repeat. Symmetrical sounds/licks are actually quite an atypical thing. Most melodies, chords, and harmonies are NOT symmetrical, so this has a special kind of sound.

Our point of departure, our first step, is just to build a diminished chord off the root of a dominant chord. From there, we get a lot of interesting material.

#1 - Diminished chord built off the root

#2 - Let's go down a whole step from those diminished chord notes

#3 - Playing the same shape/idea, but descending now

#4 - The same shape again, but now alternating the diminished notes
