

BEBOP SCALE BUTT KICKER

FROM DIGGING DEEPER VIDEO #73

Back in Digging Deeper Video #47, we were talking about Major Bebop Scales, and the cool realization that we can change direction on any note of a Bebop scale, and the chord tones still fall on the beat (which is one of the cool things about Bebop Scales).

This is a short lick/exercise/etude I used as an example in Digging Deeper #47. It's been kicking my butt for the past few weeks, so I thought I'd torture you with it too.

To my way of thinking, it hits all of the items I look when I'm wondering if something is really "worthy of my limited practice time."

- 1) It's hard and I hate it.
- 2) I understand how it works (I can play it by memory with a bit of work).
- 3) I know where I could use it in a song that I play (a Musical Goal).
- 4) I know what to aim for when I'm practicing it (a Technical Goal).

C Bebop Scale - "go up two chord tones, then down one chord tone."

The "V" symbol is just showing us where we change direction on a chord tone. It isn't some weird articulation. For this Major Bebop Scale, we call the chord tones 1 - 3 - 5 - 6.
